An Introduction To Algebraic Topology

Introduction One expects algebraic topology to be a mixture of algebra and topology, and that is exactly what it is. The fundamental idea is to convert problems about topological spaces and continuous functions into problems about algebraic objects (e.g., groups, rings, vector spaces) and their homomorphisms; the

Introduction. There is a canard that every textbook of algebraic topology either ends with the definition of the Klein bottle or is a personal communication to J. H. C. Whitehead. Of course, this is false, as a glance at the books of Hilton and Wylie, Maunder, Munkres, and Schubert reveals. Still, the canard does reflect some truth.

Definition 1.1. A TOPOLOGICAL SPACE is a pair $(X; T)$ where X is a set and T is a topology on X . A TOPOLOGY on X is a subset $T(PX)$ such that 1.the empty set and all of X are in T ; 2.if U, V are in T , then $U \cup V$ is in T ; 3. if $\{U_i\}_{i \in I}$ is a collection of sets in T , indexed by an arbitrary set I , then $\bigcap_{i \in I} U_i$ is in T . That is to say, T is

needs of algebraic topologists would include spectral sequences and an array of calculations with them. In the end, the overriding pedagogical goal has been the introduction of basic ideas and methods of thought. Our understanding of the foundations of algebraic topology has undergone subtle but serious changes since I began teaching this course.
