Nx Topology Optimization Siemens

Nx Topology Optimization is an add-on to the NX Advanced Simulation product, and so set up of the topology optimization model is very simple: • Create a FE model of the design space, loads, and boundary conditions within NX Advanced Simulation • Define which elements in the model that the optimization can modify • Define a design objective, such as maximizing stiffness • Define design constraints, such as volume, and also manufacturing constraints to ensure that the component can be produced

Topology Optimization with NX - BCT Technology AG

Extract the files to your topology_optimization folder. Start Simcenter 3D or NX. Open Bracket_02_sim1.sim. This model represents a bracket that will be affixed to two surfaces with four screws. Since the bracket is intended to be symmetrical, you will optimize only half of the model to reduce processing time.

Using topology optimization - Siemens

You can use Simcenter to define NX Nastran topology optimization and post-process the results. This feature has its own inputs and license agreement. It works with a single overall objective (such as minimizing mass) as well as one or more constraints (such as limiting displacements at specific grids).

NX Nastran Topology Optimization in Simcenter - Siemens

The output of topology optimization is a JT facet body that can be converted to a convergent facet body. Once that is done, the convergent body can be used with a traditional CAD body. If we need to rebuild the facet body as a normal CAD body instead, we can use NX Reverse Engineering functions to create an exceptionally high quality model in a short time.
