## **Quantum And Classical Molecular Dynamics**

The quantum theory of rate processes evidenced in the NMR lineshapes of molecular rotors is presented, and illustrated with appropriate experimental examples from both solid- and liquid-phase spectra. In this context, the everlasting problem of the quantum-to-classical transition is discussed at a quantitative level.

Accelerated Classical Dynamics (AXD)  
AXD [5,6] is another method to calculate the low rates of reactions. It relies on the ergodicity by separating the phase space of chemical reaction into two boxes and locking the dynamics in the box which is close to the reaction coordinate. Then the reaction event occurs much faster.

Several methods can approximate quantum dynamics with classical molecular simulations: surface hopping [49–51], mixed quantum/classical Liouville (MQCL) methods [52,53], semiclassical initial value representation (SC-IVR) approaches [6,54,55], ring polymer molecular dynamics (RPMD) [56,57], centroid dynamics [35,36], etc. The methods differ widely in their applicability to large complex systems, in their ability to correctly predict equilibrium properties, and in the degree to which they ...

In classical molecular dynamics, one potential energy surface (usually the ground state) is represented in the force field. This is a consequence of the Born-Oppenheimer approximation . In excited states, chemical reactions or when a more accurate representation is needed, electronic behavior can be obtained from first principles by using a quantum mechanical method, such as density functional theory .

## **Molecular dynamics - Wikipedia**

Path integral molecular dynamics (PIMD) is a method of incorporating quantum mechanics into molecular dynamics simulations using Feynman path integrals. In PIMD, one uses the Born-Oppenheimer approximation to separate the wavefunction into a nuclear part and an electronic part. The nuclei are treated quantum mechanically by mapping each quantum nucleus onto a classical system of several ...
